

Dear Hiring Manager,

I am writing to apply for the Backend Developer role on your team. I build and own backend systems where correctness is not optional: platforms that move money, provision infrastructure, enforce access, and stay observable when they are under load. Across two roles I have taken these systems from architecture to production, and the work below is the kind I want to keep doing at greater scale.

Most recently, at CloudTechTiq, I architected a multi-tenant hosting and billing platform on Django REST Framework spanning more than 25 apps and 230 ViewSets under a single unified API. The part I am most confident about is the money path. I designed a dual-gateway payment system across Razorpay and Stripe with HMAC-SHA256 webhook idempotency to stop duplicate charges, wired end-to-end through invoicing, provisioning, and double-entry ledger reconciliation, plus Indian GST e-invoicing against the NIC gateway with IRN generation and signed QR codes. Billing is unforgiving work where a single silent error compounds into real financial damage, and I have shipped it correctly in production.

The platform also required the full supporting system that a serious product depends on, and I built it. That includes RS512 JWT authentication with kid-keyed JWKS and refresh-token rotation over HTTPOnly cookies, a two-factor flow over email OTP and TOTP, and a 43-permission department-scoped role-based access system. On top of that I shipped real-time notifications over a Django Channels and Redis WebSocket server with JWT-authenticated async consumers, backed by a 24-task Celery system with late acknowledgement and worker-lost requeue. I care about performance under scale as much as correctness, so I eliminated N+1 queries across a dual async and sync database layer, and I set up end-to-end observability with OpenTelemetry tracing across a Prometheus, Grafana, Loki, and Tempo stack so that a failure anywhere traces back to a single request. I ship this work through multi-stage Docker builds and a GitHub Actions pipeline rather than leaving it on my machine, and I open-sourced a type-safe Namecheap SSL and domain SDK to PyPI along the way.

Earlier, at Radixlink, I built Rosterly, a multi-tenant workforce and payroll SaaS on Django and FastAPI with schema-per-tenant isolation via django-tenants. I owned the full timesheet-to-payroll-to-invoicing lifecycle, including atomic multi-assignment timesheet processing, automated payroll reconciliation on approval, Plaid bank-account aggregation with transaction sync and duplicate filtering, and multi-format financial reporting in PDF, Excel, and CSV. Across both roles the throughline is the same: I take ownership of complex, correctness-critical backend systems and make them reliable, observable, and maintainable.

I would welcome the opportunity to discuss how my experience can contribute to your team, and I am happy to walk through any of the systems above in more technical detail. Thank you for your time and consideration.

Sincerely,

Manvendra Rajpoot
