Dear Hiring Manager,

I am writing to apply for the Full-Stack Developer role on your team. I build products end to end: the database schema, the API, the payment and authentication flows, the React interface and the pipeline that ships it. I am most useful where a feature crosses every layer and someone needs to own all of it.

At CloudTechTiq I architected a multi-tenant hosting and billing/ERP platform on Django REST Framework, more than 25 apps and 230 ViewSets behind one API. I designed its dual-gateway payment system across Razorpay and Stripe with HMAC-SHA256 webhook idempotency, wired through invoicing, provisioning and double-entry ledger reconciliation, and GST e-invoicing against the NIC gateway. I built an OAuth2/OpenID FastAPI gateway to Apache CloudStack that streams job progress over Server-Sent Events, and secured the platform with RS512 JWT and JWKS, two-factor sign-in and department-scoped RBAC, with real-time notifications over Django Channels and Celery for background work.

On the same platform I built the customer and admin console in React 18, Redux Toolkit and Vite across 35+ feature modules, including an in-browser VM terminal on xterm.js, Razorpay checkout and Microsoft sign-in through MSAL. I also built Workforce, an HR platform with a FastAPI backend and a React 19 TypeScript frontend, connected to the console by SSO token exchange, and I shipped all of it through multi-stage Docker images and GitHub Actions publishing to GHCR.

Along the way I have built offline-first React 19 patterns with TanStack Query and an IndexedDB outbox that replays writes on reconnect, typed TypeScript API layers with Zod and Pydantic contracts and OpenAPI specs, and fast static web surfaces in Next.js and Astro with a strict Content Security Policy and Lighthouse CI budgets. I plan migrations with written runbooks that carry a check and a rollback for every step, and gate releases on a test-parity check so nothing silently loses coverage. My portfolio, rajpoot.dev, is Next.js 16 with Playwright across browsers and a coverage gate in CI.

Working across the stack has taught me to design the contract first, to treat payments and authentication as the parts that cannot fail, and to write the decisions down so the team can move quickly without re-arguing them. I am equally comfortable in a Django serializer, a Hono route, a React component or a GitHub Actions workflow, and I enjoy the moments where a bug crosses all of them and someone has to follow it from the browser down to the database and back.

I would welcome the chance to discuss how this experience fits your team, and I am happy to walk through any of the systems above in technical detail. Thank you for your time and consideration.

Sincerely,

Manvendra Rajpoot
